PLS - 3778
FOR RELEASE:
THURSDAY, OCTOBER 5, 2000

WASHINGTON AREA WORKPLACE FATALITIES, 1999

The number of fatal workplace injuries in the Washington-Baltimore Consolidated Metropolitan Statistical Area (CMSA) was 113 in 1999, up 13 over the year, according to the U.S. Department of Labor's Bureau of Labor Statistics. Alan M. Paisner, the Bureau's regional commissioner, noted that virtually all of the increase in fatalities in the CMSA occurred in the Washington Primary Metropolitan Statistical Area (PMSA). With 74 job-related deaths, the Washington PMSA accounted for nearly two-thirds of the fatalities in the CMSA. Two areas in the Washington PMSA—Prince George's County, MD and the District of Columbia—made up close to 30 percent of all CMSA fatalities and over 40 percent of workplace deaths in the PMSA. (See table A.)

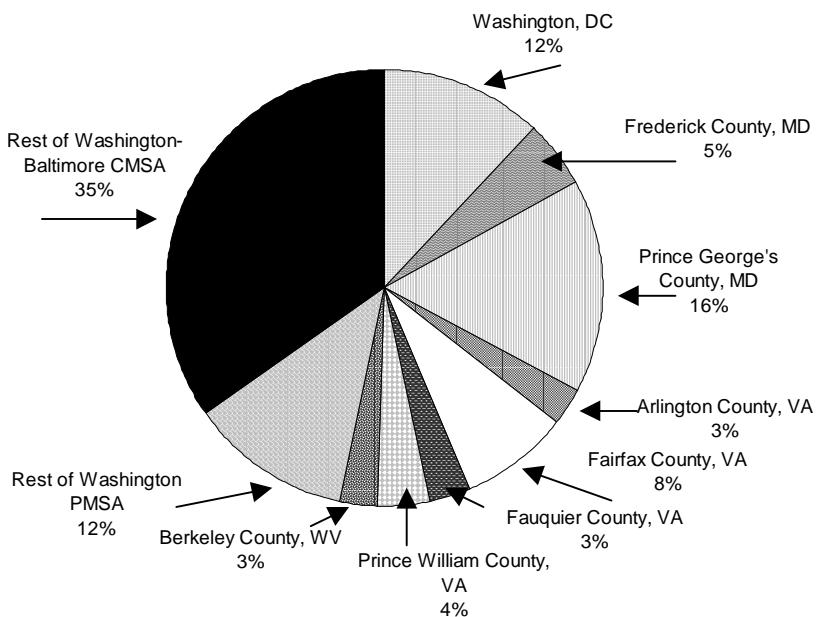

Table A. Fatal occupational injuries for selected events, Washington-Baltimore CMSA, Washington PMSA, Prince George's County, MD, and Washington, DC, 1993-99

1998	13	--	--	5	38
1999	14	3	21	--	--

NOTE: Categories that do not meet publication criteria are not shown.

Transportation-related incidents were the leading cause of workplace fatalities in the PMSA in 1999 accounting for 41 percent or 30 deaths, of which about half were highway-related incidents. Assaults and violent acts were second with 17 job-related fatalities; 14 of which were homicides. Falls ranked third with 12 fatalities. This pattern was repeated in the larger CMSA. (See table 1 and chart 1.)

Chart 1. Distribution of workplace fatalities by county of occurrence, Washington-Baltimore, CMSA, 1999

Nationwide, the number of fatal work injuries was 6,023, nearly the same as the previous year's total despite an increase in employment. On a detailed level, highway incidents continued as the leading cause of on-the-job fatalities during 1999, accounting for one-fourth of the fatal work injury total. Decreases in job-related deaths from homicides and electrocutions in 1999 were offset by increases from workers struck by falling objects or caught in running machinery. (See table B.)

Summary data show that transportation incidents, which includes highway, nonhighway, pedestrian, air, water and rail fatalities, accounted for 43 percent of all fatal occupational injuries nationwide. Contact with objects and equipment, which includes struck by an object, caught in equipment and crushed in collapsing materials, made up 17 percent of on-the-job deaths while assaults and violent acts, which includes homicides and suicides, accounted for 15 percent. On average, about 17 workers were fatally injured each day in the United States during 1999.

Table B. Fatal occupational injuries for selected events, United States, 1993-99

Year	Total fatalities	Transportation related		Homicides	
		Number	Percent of total	Number	Percent of total
1993	6,331	2,499	39	1,074	17
1994	6,632	2,762	42	1,080	16
1995	6,275	2,587	41	1,036	17
1996	6,202	2,601	42	927	15
1997	6,238	2,605	42	860	14
1998 ¹	6,055	2,645	44	714	12
1999	6,023	2,613	43	645	11

¹The BLS national news release issued August 4, 1999, reported a total of 6,026 fatal work injuries for calendar year 1998. Since then, an additional 29 job-related fatalities were identified, bringing the total job-related fatality count for 1998 to 6,055.

This release presents the results from the 1999 Census of Fatal Occupational Injuries (CFOI), a Federal/State cooperative program in which all 50 states and the District of Columbia participate. The program provides workplace fatality data by occupational, industrial, and demographic characteristics as well as type of event. Key elements of the results for the Washington-Baltimore area follow:

Washington-Baltimore CMSA:

- Highway incidents accounted for one-fourth of the fatalities, while homicides accounted for almost one-fifth. (See Table 1.)
- Eighty-eight percent of those killed were men and 12 percent were women. (See table 2.)
- Sixty percent of those fatally injured were white, 29 percent were black, and 8 percent were Asian.
- Workers aged 25-54--the prime working age group--experienced 70 percent of the fatalities in 1999 in the CMSA.
- Nearly three-quarters of the workers killed on the job worked for wages and salaries; the remainder were self-employed.
- Workers in the construction industry accounted for 36 or almost one-third of the CMSA fatalities; transportation-related incidents were responsible for 16 of these deaths, half due to pedestrian incidents, while 12 others were due to fatal falls.
- One-fifth of area fatalities occurred in transportation and public utilities accounting for 23 deaths of which 14 were due to highway incidents and 4 were homicides. (See table 3.)
- All six of the fatalities in grocery stores were homicides.
- Two occupational groups accounted for over one-third of all workplace deaths -- motor vehicle operators and construction laborers, with 24 and 15 fatalities, respectively. (See table 4.)
- Robbery was the primary motive of job-related homicides when a reason could be ascertained accounting for half of the alleged perpetrators. Six or almost half of the 13 work-related fatalities among women in the CMSA were homicides.

Washington PMSA:

- Almost one-fourth of all work-related fatalities in the PMSA occurred in Prince George's County, MD; almost one-fifth happened in Washington, DC.
- Transportation-related incidents increased by 9 in 1999; the number of homicides was unchanged over the year.
- Thirty-four percent of the total PMSA work-related fatalities occurred in the construction industry, 16 percent in transportation and public utilities, and 14 percent in agriculture.
- Operators, fabricators, and laborers accounted for 31 deaths or 42 percent of all PMSA fatalities in 1999. Within this occupational grouping, motor vehicle operators had 13 fatal work-related incidents and construction laborers had 11. (See table 4.)

Prince George's County, MD:

- Homicides accounted for 56 percent of the county's total fatalities and 45 percent of all homicides that occurred in the entire CMSA. When a motive could be ascertained for these ten homicides, the source documents indicated that 40 percent of the alleged perpetrators were robbers.
- The agriculture and construction industries each recorded three fatalities in 1999.
- Occupationally, operators, fabricators, and laborers accounted for ten deaths or 56 percent of the county's work-related fatalities.

Washington, D.C.:

- The leading cause of the 14 work-related deaths in the District in 1999 was falls to a lower level, accounting for five of the District's fatalities.
- Seventy-nine percent of those fatally injured at work were black; 21 percent were white.
- Forty-three percent of those who died on the job worked in construction.

The CFOI program is designed to provide the safety and health community with verified counts of fatal work injuries as well as basic information on fatalities that can be used to help prevent future fatalities in the workplace.

TECHNICAL NOTES

The source for data in the tables is the Bureau of Labor Statistics, Census of Fatal Occupational Injuries, 1999; and the District of Columbia Department of Health; Maryland Department of Labor, Licensing, and Regulation; Virginia Department of Labor and Industry; and West Virginia Department of Labor.

Information on fatal occupational injuries were compiled from a variety of administrative sources including death certificates, motor vehicle traffic accident reports, medical examiners reports, State and Federal workers' compensation reports, and other government investigative reports. Each fatality was substantiated by either two independent source documents or one source document and a follow-up questionnaire to the employer or other contact (excluding next-of-kin) who had knowledge about the circumstances of the incident.

While the purpose of the Census of Fatal Occupational Injuries is to compile a complete count of traumatic workplace fatalities, information was also collected on fatal occupational illnesses that were recognized as work-related or that occurred at work. (There is not necessarily a causal relationship implied for illness deaths occurring at work.) A comprehensive count of fatalities resulting from occupational illnesses cannot be produced from current data largely because of the latency period associated with many occupational illnesses, as well as the difficulty in associating illnesses with exposures in the workplace. Therefore, fatal occupational illnesses are excluded from the tables.

The Washington-Baltimore, D.C.-Md.-Va.-W.V., CMSA consists of the Baltimore, Md., PMSA; the Hagerstown, Md., PMSA; and the Washington, D.C.-Md.-Va.-W.V., PMSA. The Baltimore, Md., PMSA is composed of Anne Arundel, Baltimore, Carroll, Harford, Howard, and Queen Anne's Counties and Baltimore City in Maryland. The Hagerstown, Md., PMSA consists of Washington County in Maryland. The Washington, D.C.-Md.-Va.-W.V., PMSA consists of the District of Columbia; Calvert, Charles, Frederick, Montgomery, and Prince George's Counties in Maryland; Arlington, Clarke, Culpepper, Fairfax, Fauquier, King George, Loudoun, Prince William, Spotsylvania, Stafford, and Warren Counties, and Alexandria, Fairfax, Falls Church, Fredericksburg, Manassas, and Manassas Park Cities in Virginia; and Berkeley and Jefferson Counties in West Virginia.
